# PaperEagle:

This particular type of invention is able to save lives in conflicts against other human beings with edged weapons and even sometimes with firearms, built entirely by hand. The bulletproof vest obviously serves for defense, to build one so that it also allows it to be camouflaged with other clothing and allowing the person to get out you have to put a few layers of paper at least to stop a blade, wrap them with scotch tape, create plates and attach them with hot glue, velctro, double-sided adhesive or other glue to hold the plates firm,  A paper clip and stapler combined with adhesive tape is also fine. This construction is built specifically to help civilians in case of siege, riot and much more, it can be combined with a motorcycle helmet, knee pads, motorcycle clothing, and even shields made with the lids of garbage cans creating a real riot cover.
